

MEMBER DETAILS AND LOGIN FLOW - PROCESS FLOW DOCUMENTATION

The User Management Web API enables users to register, log in, and manage their profile information. The project follows a modular design pattern using .NET 8 and includes the following key components:

Registration: Users can register with mandatory fields.

Login: Users can log in to access and update their profile.

Profile Management: Users can update additional profile fields after logging in.

1. User Registration

As a new user, I want to register for an account by providing my First name, Last Name, email, and password, so that I can create a basic account and log in to access further features.

Input:

User visits the registration page and inputs First name, Last name, email, and password.

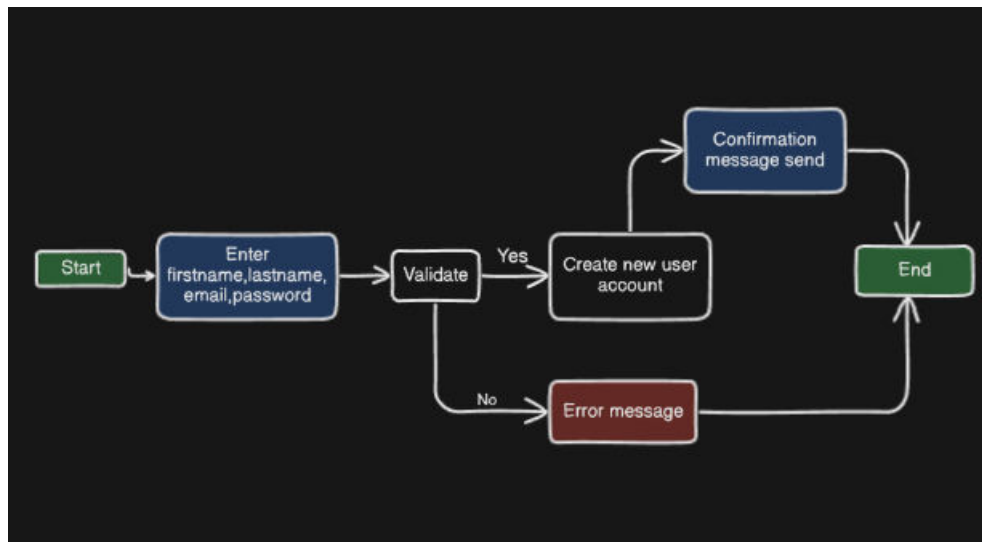

Validation:

1. System validates the inputs: Ensures email is unique and properly formatted. Password meets security requirements.
2. If valid: The system creates a new user account with only basic details.
3. User receives a success message: 'Account created successfully!'
4. If invalid: The system shows error messages for fields that failed validation (e.g., 'Email already exists').

Processing:

Save user details in the Users table with CreatedOn timestamp.

Output: Success or failure message.

2. User Login

I want to log in to the application using my email and password, so that I can access my account and use the application's features.

Validation:

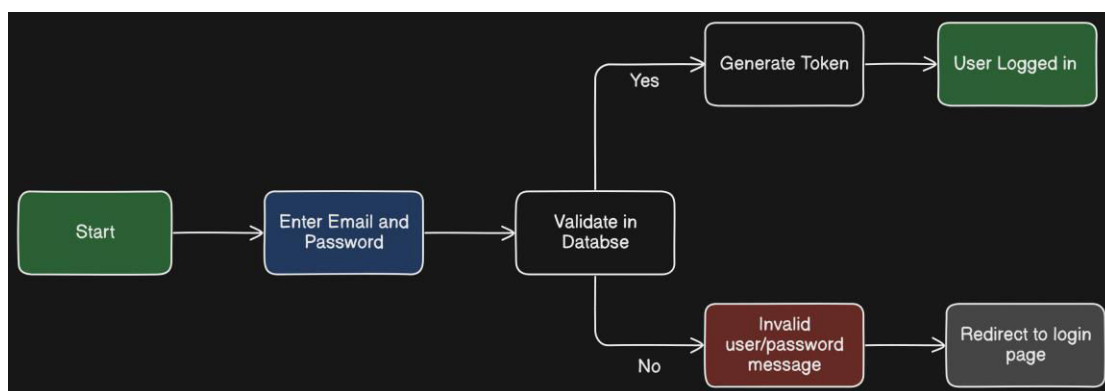

Verify if the email exists in the database.

Validate the password using the stored hashed password.

Processing:

Generate a session token (JWT) upon successful login.

Output: JWT token and success or failure message.

User Story 3: Password Recovery

As a user who has forgotten their password, I want to recover my password by providing my email address, so that I can reset my password and regain access to my account.

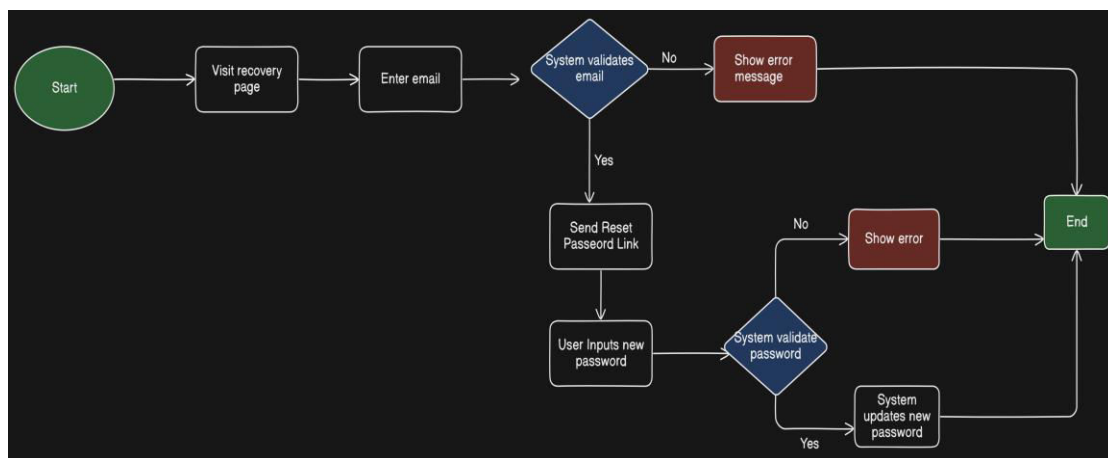

Input: Email

User visits the password recovery page.

User inputs their email address.

Validation: System validates the email. If valid, system sends a password reset link to the email.

Output: Reset link if success and success or failure message

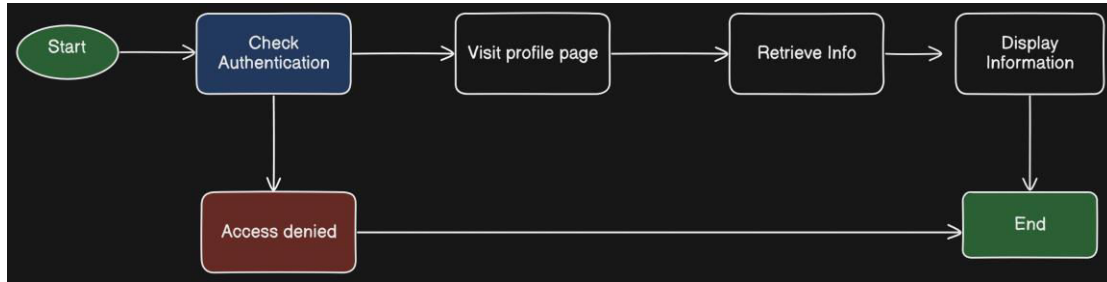

User Story 4: View Profile

As a logged-in user, I want to view my profile information, so that I can see my personal details and account information.

Acceptance Criteria:

1. User navigates to the profile page.

2. System retrieves the user's profile information from the database.
3. User sees their profile information (name, email, etc.) displayed on the page.

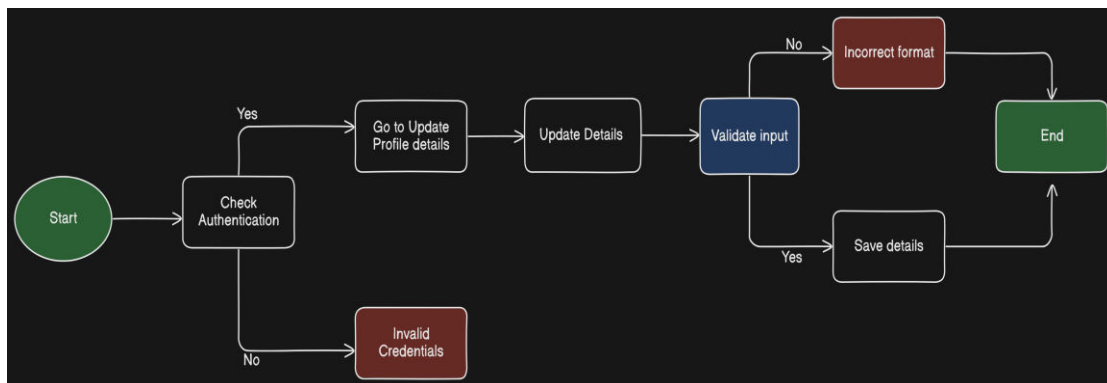

User Story 5: Update Profile

As a logged-in user, I want to update my profile information, so that my account details are current and accurate.

Acceptance Criteria:

1. User updates their profile details (name, address, phone number, etc.).
2. System validates the input.
3. If valid, system updates the user's profile information in the database.
4. User receives confirmation of the update.
5. If invalid, user is shown appropriate error messages.

User Story 6: Change Password

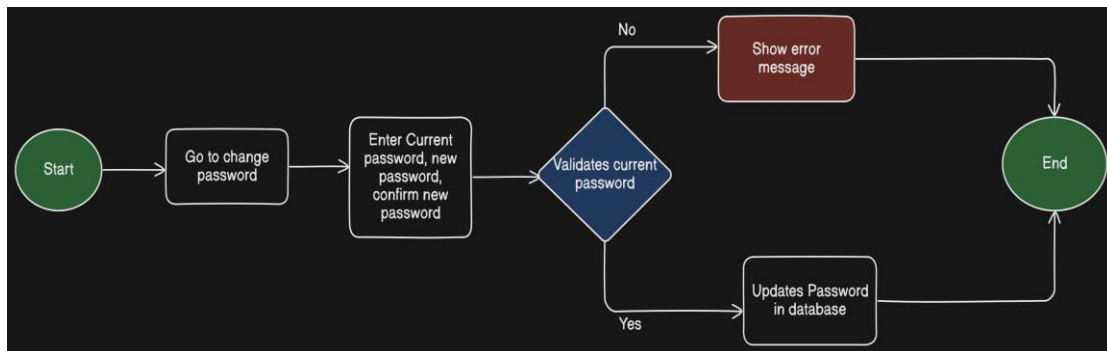

As a logged-in user,

I want to change my password,

so that I can enhance the security of my account.

Acceptance Criteria:

1. User navigates to the change password page.
2. User inputs current password, new password, and confirmation of the new password.
3. System validates the current password.
4. System checks if the new password meets security requirements.
5. If valid, system updates the password in the database.
6. User receives confirmation of the password change.
7. If invalid, user is shown appropriate error messages.

User Story 7: Logout

As a logged-in user, I want to log out of the application, so that I can end my session and ensure no unauthorized access to my account.

Acceptance Criteria:

1. User clicks the logout button.
2. System invalidates the session token.
3. User receives confirmation of a successful logout.
